Social learning

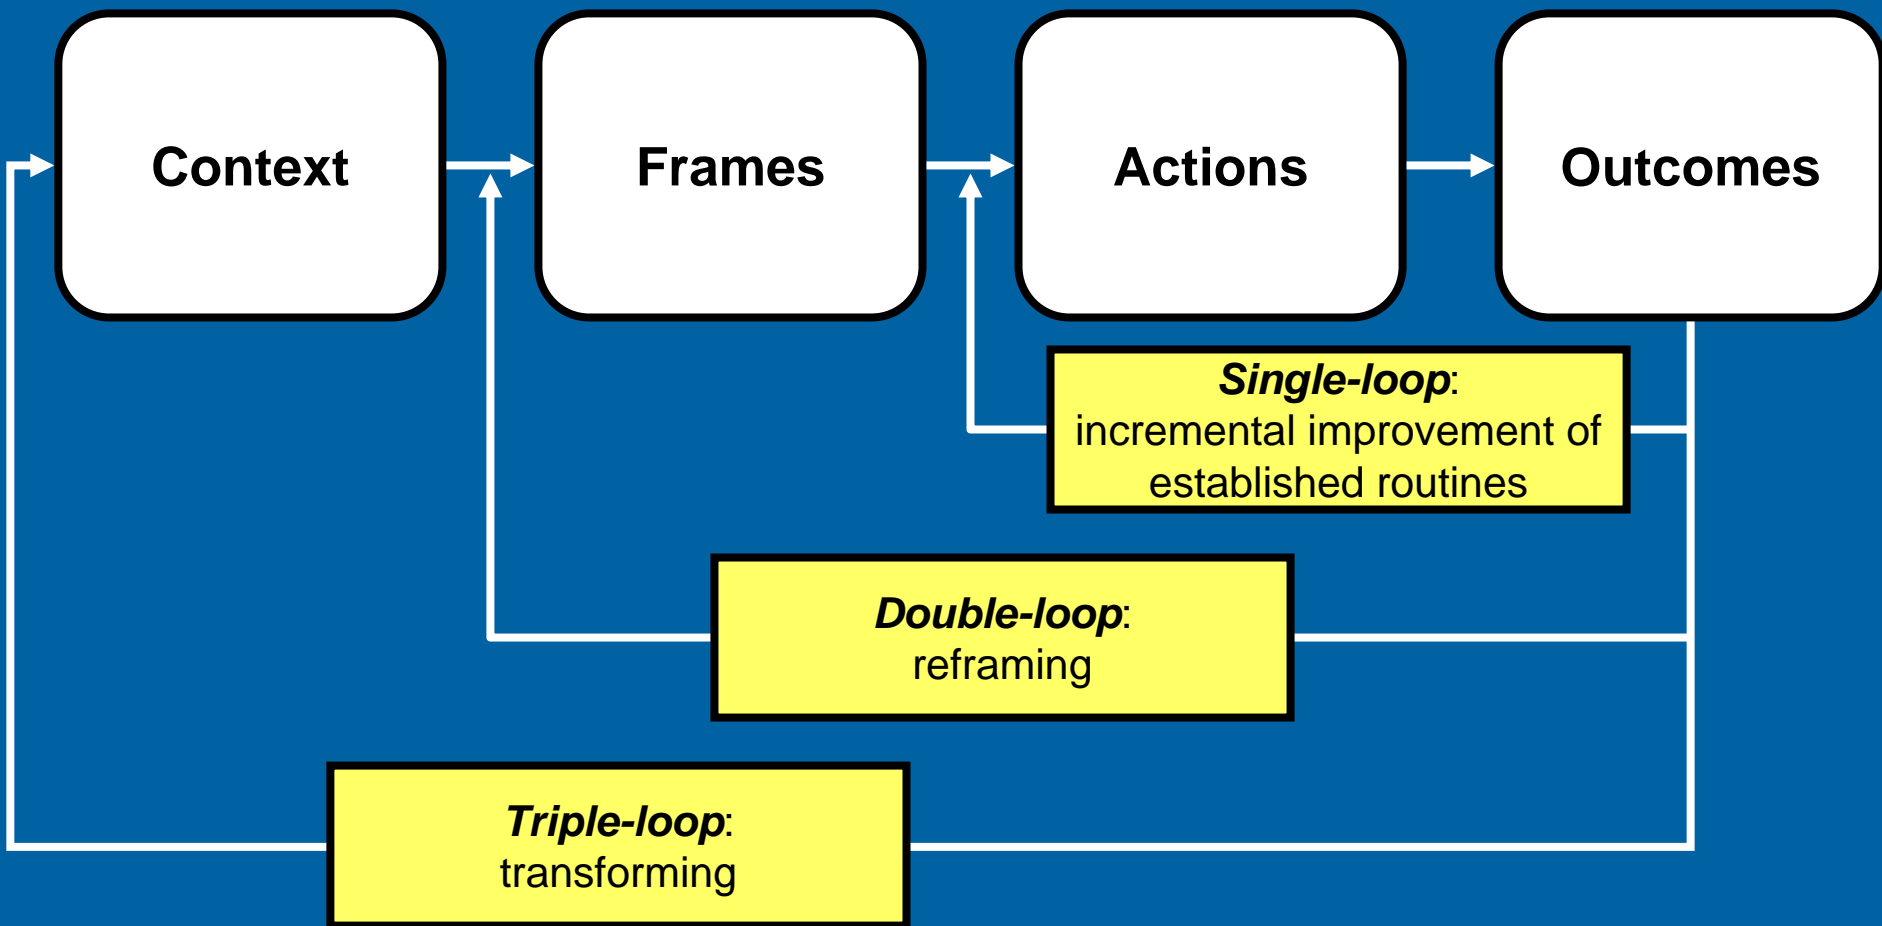

### ABSTRACT

Governance failures are at the origin of many resource management problems. In particular climate change and the concomitant increase of extreme weather events has exposed the inability of current governance regimes to deal with present and future challenges. Still our knowledge about resource governance regimes and how they change is quite limited. This paper develops a conceptual framework addressing the dynamics and adaptive capacity of resource governance regimes as multi-level learning processes. The influence of formal and informal institutions, the role of state and non-state actors, the nature of multi-level interactions and the relative importance of bureaucratic hierarchies, markets and networks are identified as major structural characteristics of governance regimes. Change is conceptualized as social and societal learning that proceeds in a stepwise fashion moving from single to double to triple loop learning. Informal networks are considered to play a crucial role in such learning processes. The framework supports flexible and context sensitive analysis without being case study specific.

First empirical evidence from water governance supports the assumptions made on the dynamics of governance regimes and the usefulness of the chosen approach. More complex and diverse governance regimes have a higher adaptive capacity. However, it is still an open question how to overcome the state of single-loop learning that seem to characterize many attempts to adapt to climate change. Only further development and application of shared conceptual frameworks taking into account the real complexity of governance regimes can generate the knowledge base needed to advance current understanding to a state that allows giving meaningful policy advice.

# Examples from waterfowl management

- **Single loop: are we doing things right?**
  - Explicit accounting for sequential decision-making
  - Passive adaptive management – improving model-based predictions
- **Double loop: are we doing the right things?**
  - Model adequacy (parametric and functional form)
  - Ideological debates about harvest-management objectives
  - Relationship between harvest and habitat mgmt goals
  - Multi-stock management
  - Effectiveness of waterfowl programs & institutions
- **Triple loop: who has the right?**
  - Stakeholders – who are they? how will their interests be represented and served?
  - Relationship of waterfowl mgmt to broader conservation enterprise
  - The changing face of conservation (e.g., biodiversity, climate change)

# Selective pressures

- Single-species harvest management: mallards, pintails, scaup, black ducks, wood ducks, mottled ducks
- Integration and coherence of harvest and habitat management
- Multi-stock harvest management
- Understanding stakeholders
- NAWMP Revision
- Climate change

Single loop

Double loop

Triple loop
